Two types of tables:

1) Reference tables

- for future reference or documentation purposes
- often big (typically: One page or more)
- detailed (many indicators/classifications).
- often present exact, absolute numbers
- often have a standardized structure
- Now increasingly replaced by data warehouses and data banks, where users can construct their own tables

Example: Typical reference table

2) Presentation tables

- smaller and simpler (extract from or summary of a reference table)
- main function is to present the numbers in a user-friendly way
- presentation of “indicators” (percentages, rates, indices, averages) rather than absolute numbers
- numbers are often rounded
- focused (few variables; often only two) (in this respect, presentation tables can be compared to graphs)
- used in press releases, presentations/analyses to illustrate some specific point

Example: Typical presentation tables

Using percentages makes it easier to compare and understand the figures!

And:

Number of children per divorce is better than per 1 000 divorces.
