Executive Summary

The aim of this report is to identify the current performances of the OIC countries on the core environmental issues such as air and water pollution, land protection and greenhouse emissions, in light of the data and information taken from the Pilot 2006 Environmental Performance Index (EPI). The index is being prepared and published by the Yale University's Environment School and Earth Institute at Columbia University in collaboration with World Economic Forum and Joint Research Centre of the European Commission. The Pilot 2006 EPI identifies targets for environmental performances and measures how close each country comes to achieving these goals. Specifically, the report evaluates overall environmental performance of the OIC countries as compared to the averages of the world, developed and developing countries and the performance of each OIC country individually, in this regard.

The EPI scores provide a basis to make sound comparisons across the overall environmental performances of the countries. Furthermore, by comparing each country's performance in Air Quality, Water Resources, Biodiversity and Habitat, Productive Natural Resources, Sustainable Energy and Environmental Health categories, it enables a more detailed assessment among countries. The EPI is also oriented towards supplementing the environmental targets specified in the United Nations' Millennium Development Goals. It will thus contribute to achieving long-term environmental sustainability targets.

Based on the data and information taken from the Pilot 2006 EPI, the report concludes that the performance of OIC countries is fairly comparable on various environmental issues with other non-OIC countries. In addition to the comparative analysis of environmental performance at the OIC level, the performance of each OIC country (for which data is available) is also presented in a detailed manner.

Top 5 OIC countries with respect to environmental performance as summarized by the Environmental Performance Index (EPI 2006) are Malaysia, Lebanon, Gabon, United Arab Emirates and Suriname, respectively. Compared to the world average, it appears that the majority of the OIC countries are required to improve their performances in the Environmental Health, Air Quality, Water Resources, Biodiversity and Habitat and Sustainable Energy categories in order to achieve higher environmental quality. Thus, the OIC countries need to enhance efforts in achieving better performance in Child Mortality, Indoor Air Pollution, Drinking Water, Adequate Sanitation, and Urban Particulates (Environmental Health indicators), Regional Ozone concentrations (Air Quality indicator), Nitrogen Loading and Water Consumption (Water Resources indicators), Water Consumption, Wilderness Protection, Ecoregion Protection and Timber Harvest Rate (Biodiversity and Habitat indicators), Energy Efficiency, Renewable Energy, and CO₂ per GDP (Sustainable Energy indicators).

Introduction

The aim of this report is to evaluate the current performances of the OIC countries on the core environmental issues such as air and water pollution, land protection and greenhouse emissions, in the light of the data and information taken from the Pilot 2006 Environmental Performance Index (EPI)¹. EPI identifies targets for environmental performance, measures the current situation in each of the above outlined categories and also evaluates how close each country stands from the set targets. EPI is also a useful tool in providing guides to policy-makers on the core environmental issues. EPI will be used in this paper as the basis for the evaluation and for drawing up policy-making guidelines in order to help achieving better performance levels for the OIC countries.

It is important to note that the environmental issues have gained importance especially due to the targets set forth in the United Nations' Millennium Development Goals (MDG) and became the focus of the world agenda. Indeed, environmental issues require a lot of attention due to the fact that many countries lack in maintaining sustainability in the environmental issues, let alone recording improvements in them.

In order to elaborate more on the upcoming challenges for the OIC countries in promoting environmental sustainability within the framework of EPI, the present report will try to find answers to the following questions:

1. How can we measure environmental performance of the countries?
2. Based on the overall EPI results, how does the current environmental performance of the OIC countries compare with other countries?
3. Is there any correlation between the EPI and other variables or indices such as GDP per capita and good governance?
4. What is the current performance of the OIC countries in meeting the set targets in the Pilot 2006 EPI?

¹ The EPI is produced by a team of environmental experts at the Yale University's Environment School and Earth Institute at Columbia University. The EPI was conducted in collaboration with the World Economic Forum and Joint Research Centre of the European Commission. It was formally released in Davos, Switzerland, at the annual meeting of the World Economic Forum on 26 January 2006.

1. Environmental Performance Index: A Framework for Evaluating the Environmental Performance of Countries

Although renewed efforts have been made in producing quantitative environmental metrics, it often resulted with criticism for not being useful in providing effective policy guidelines. In this respect, world-wide efforts to address the current global development challenges have led environmental experts to undertake studies using quantitative environmental metrics to assist governments in designing policies on the environment and environment-related issues. In this context, the Pilot 2006 Environmental Performance Index (EPI) was produced as a part of the ongoing efforts to provide a better policy guide for policy makers. It is a work in progress that constitutes an initial response to the criticisms made on the existing quantitative environmental metrics, including the 2005 Environmental Sustainability Index (ESI) which has been criticized for being overly broad.

The Pilot 2006 EPI offers a composite index of current national environmental protection results (Pilot 2006 Environmental Performance Index). It highlights peer-reviews on a cross-country basis to evaluate the current performances of countries. It mainly tracks performance changes over time with respect to clearly identified, achievable targets.

Although it builds on the best environmental data available, data sets in the Biodiversity & Habitat category is not enough. On the other hand, limited data exists in the Productive Natural Resources category. Furthermore, relying on a few data sets in the respective categories made it difficult to collect reliable data on some countries. Therefore, as a result of lacking complete data, 13 out of the 57 OIC countries are not covered in the Pilot 2006 EPI. These countries are as follows: Afghanistan, Bahrain, Brunei, Comoros, Djibouti, Guyana, Iraq, Kuwait, Libya, Maldives, Palestine, Somalia, and Qatar.

The EPI ranks 133 countries on 16 indicators. These indicators are based on existing international agreements, scientific evidence on the harmful impacts of pollution on humans and ecosystems, and economically feasible environmental protection strategies. These indicators determine performance levels in the six policy categories that are used in quantifying the following broad environmental protection objectives (Table 1):

- A. Reducing Environmental Stresses on Human Health (Environmental Health)
- B. Protecting Ecosystem Vitality and Natural Resource Management

Three levels of aggregation are used. Firstly, indicator scores are aggregated to get the scores on each of the 6 policy categories. Then, scores are calculated within the two broad objectives. Next, a calculation of the five policy categories linked to the second objective is undertaken. Finally, the overall EPI is calculated by taking the averages of two broad objective scores with equal weighting of 50 percent each. The indicators used in each policy category are shown in Table 1, and the computational procedure is depicted in Table C.1 in Annex C.

The Pilot 2006 EPI follows a rather narrow tracking on actual results obtained from the above mentioned environmental issues. **Environmental Health** is determined by indoor air pollution, drinking water, adequate sanitation, child mortality and urban particulates. Among the indicators stated in the EPI, indoor air pollution poses by far the most severe threat, accounting for several million premature deaths per year. Overcoming its hazardous effects on mankind requires strict policies to address the issue more effectively.

Table 1: EPI Objectives, Policy Categories, Indicators, Targets

Objectives	Policy Categories	Indicators	Target	Weight within Category	Weight within EPI
ENVIRONMENTAL HEALTH	Environmental Health	INDOOR	0% of households using solid fuels	.22	.50
		WATSUP	100% access	.22	
		ACSAT	100% access	.22	
		MORTALITY	0 deaths per 1000 pop aged 1-4	.21	
		PM10	10 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$)	.13	
ECOSYSTEM VITALITY AND NATURAL RESOURCE MANAGEMENT	Air Quality	PM10	10 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$)	.50	.10
		OZONE	15 parts per billion (ppb)	.50	
	Water Resources	NLOAD	1 mg/liter	.50	.10
		OVRSUB	0% oversubscription	.50	
	Biodiversity and Habitat	OVRSUB	0% oversubscription	.07	.10
		PWI	90% of wild areas protected	.39	
		PACOV	10% for all biomes	.39	
		HARVEST	3%	.15	
	Productive Natural Resources	HARVEST	3%	.33	.10
		OVRFSH	No overfishing	.33	
		AGSUB	0%	.33	
	Sustainable Energy	ENEFF	1650 Terajoules per million \$ GDP	.43	.10
		RENPC	100%	.10	
CO2GDP		0 net emissions	.47		

Source: Pilot EPI 2006 Report, p.14.

Note: INDOOR: Indoor Air Pollution; WATSUP: Drinking Water; ACSAT: Adequate Sanitation; MORTALITY: Child Mortality; PM10: Urban Particulates; OZONE: Regional Ozone; NLOAD: Nitrogen Loading; OVRSUB: Water Consumption; PWI: Wilderness Protection; PACOV: Ecoregion Protection; HARVEST: Timber Harvest Rate; OVERFSH: Overfishing; AGSUB: Agricultural Subsidies; ENEFF: Energy Efficiency; CO2GDP: CO2 Per GDP.

On the other hand, levels of urban particulates and regional ozone, measured as micrograms per cubic meter and ozone concentration parts per billion, respectively, are used to indicate the **Air Quality** of a country. **Water Resources**, on the other hand, plays a significant role in many aspects of human life, thus human impact on water resources is expected to create environmental challenges for the mankind. As a result, environmental challenges are often likely to impose greater pressure on governments to make the right policy choices. The only indicators available for the Water Resources in the EPI are nitrogen loading per average flow of a country's river basins and the percentage of territory that is affected by oversubscription of water resources. **Productive Natural Resources** category relates to the good management

of natural resources to maintain integrity in the environment. **Biodiversity and Habitat** reflects a country's current performance in biodiversity conservation and habitat protection. Eco-region Protection and Wilderness Protection, which are the indicators on protected areas, are measures of the evenness of protected areas depending on the climate and nature, and the degree to which the country's wildest areas are protected. Timber Harvest Rate, on the other hand, reflects the significant concentration of biodiversity in forest areas, whereas Water Consumption, which also falls under this category, reflects the important role that water plays in sustaining the ecosystems (Pilot 2006 Environmental Performance Index). Lastly, **Sustainable Energy** relates to a country's prospects in having a sustainable energy future.

A country's performance in Sustainable Energy category is determined by its exposure to climate change, thus requiring a good performance in energy consumption per unit GDP (Energy Efficiency), renewable energy production as a percentage of total domestic energy consumption (Renewable Energy) and emissions per GDP (CO₂ per GDP).

Table 1 gives an overview of the EPI objectives, policy categories, indicators, targets, and weights within each category and the categories within the EPI. "To make the 16 indicators comparable, each was converted to a proximity-to-target measure with a theoretical range of zero to 100. To avoid extreme values skewing aggregations, the indicator values for "outlier" countries were adjusted to make them equal to the value of the 5th percentile country, a recognized statistical technique called winsorization. To avoid rewarding "over-performance", no indicator values above the long-term target were used. In few cases where a country did better than the target, the value was reset so that it was equal to the target. Once those two adjustments were made, a simple arithmetic transformation was undertaken – stretching the observed values onto a zero to 100 scale, where 100 corresponded to the target and zero to the worst observed value" (Pilot 2006 Environmental Performance Index, p.12).

2. Comparative Analysis on Peer Groups: The OIC, Developed and Developing Countries

Based on the overall EPI results, how does the current environmental performance in the OIC countries compare with other countries? Compared to the world average, the OIC countries have not performed satisfactorily with regard to the Environmental Health, Air Quality, Water Resources, Biodiversity and Habitat, and Sustainable Energy categories (Table 2). On the other hand, they appear to have performed quite satisfactorily in terms of the Productive Natural Resources category. Other Developing Countries, however, are observed to have performed better in the Air Quality, Water Resources and Productive Natural Resources, Sustainable Energy and Biodiversity and Habitat categories compared to the world average. These countries performed weakly in the Environmental Health category. In case of the Developed Countries, a relatively high performance is observed in the Environmental Health category, as compared to the World average, whereas their performance in the Air Quality, Productive Natural Resources and Sustainable Energy categories is not significantly higher. On the other hand, these countries showed a rather weak performance in the Biodiversity and Habitat and Productive Natural Resources categories.

Compared to the Developed Countries, both the OIC and the developing countries show relatively weak performances in overall EPI (Table 2). The high performance of the Developed Countries is mainly derived from the extremely high score of this group in the Environmental Health category. With respect to Productive Natural Resources category, the OIC countries perform better than Developed Countries.

Table 2: Average Scores of OIC, Developed and Developing Countries

	Overall EPI Scores	ENV. HEALTH Environmental Health	ECOSYSTEM VITALITY & NAT. RES. MGMT.				
			Air Quality	Water Resources	Biodiversity & Habitat	Productive Natural Res.	Sustainable Energy
OIC Countries	55.7	50.3	47.3	73.7	46.4	77.8	60.5
Developed C.	81.3	97.3	56.8	87.2	47.4	59.7	75.7
Developing C.	63.7	58.5	58.6	85.7	55.4	77.5	67.2
World	64.5	63.4	54.4	81.9	50.7	74.1	66.5

Source: Derived from tables in Annex A. Note: High score indicate that the countries are closer to the target.

Although the OIC and the Developing Countries tend to have similar characteristics, it is observed that the Developing Countries performed relatively better in the Environmental Health, Air Quality, Water Resources, Biodiversity and Habitat, and Sustainable Energy categories (Table 2). On the other hand, the OIC countries performed slightly better in Productive Natural Resources category when compared to the performance of the Developing Countries in the same policy category.

The EPI report also includes a cluster analysis. The cluster analysis provides a basis for identifying peer groups that are similarly situated with respect to individual indicators to assist governments in policy-making. The process of identifying peer groups “generated six country clusters that seem useful as a method that would help

countries look beyond income-levels or geographic peer groups as models of environmental success in countries facing similar challenges” (Pilot 2006 Environmental Performance Index).

Cluster 1 comprises countries with fairly close targets for Environmental Health and Productive Natural Resources indicators, but far from targets concerning Sustainable Energy and Biodiversity and Habitat indicators.

Cluster 2 includes countries that are moderately better than the average across the board and characterised by good Water Systems but poor Air Quality.

Cluster 3 is made up of countries that are moderately below average across the board and face challenges of building environmental infrastructure, as well as in developing systems to control air and water pollution and to protect ecosystems.

Cluster 4 comprises countries with very low environmental health scores.

Cluster 5 groups together wealthy countries with average ecosystem scores.

Cluster 6 brings together wealthy countries with above-average ecosystem scores.

As it can be seen from the Table B.2 in the Annex, most OIC countries appear to be in Cluster 4, which groups countries with very low environmental health scores. Countries grouped in Cluster 4 include most of the least developed countries of Sub-Saharan Africa and a few from Asia. All the countries grouped in Cluster 4 face sustainable development challenges and environmental health threats. While environmental health performance is very poor among the countries in the same cluster, other measures appear to be relatively good, reflecting low levels of industrialisation in those countries. Yet, most of the OIC countries in Cluster 4 appear to have extremely low scores in air quality. Only Jordan from the OIC countries managed to be placed in Cluster 5, which includes wealthy countries with average ecosystem scores (Table B.2 in the Annex B). “Compared to the other wealthy countries, this group does significantly worse in terms of natural resource management and slightly better in terms of biodiversity protection” (Pilot 2006 Environmental Performance Index). Accordingly, Jordan’s EPI is mainly driven by its performance in environmental health.

There appears to be a correlation between the EPI and GDP per capita, good governance and Human Development Index. The results on some indicators showed that certain environmental issues have not been the focus of major policy action as they were negatively correlated with economic development. For example, regional ozone concentrations have increased as a result of transport projects that aimed to improve the capacity in that sector. Moreover, it was found that good environmental results correlate significantly with good governance. In another analysis, based on the relationship between the EPI and the World Economic Forum’s Global Competitiveness Index (GCI), it is also found that countries with good environmental results tend to be competitive. Thus, by sacrificing good environmental results countries may not expect to become more competitive.

3. Environmental Performance of the OIC Countries within the Pilot 2006 EPI

What is the current performance of the OIC countries in meeting the set targets in the Pilot 2006 EPI? The top 5 ranking countries in the EPI are New Zealand, Sweden, Finland, Czech Republic and United Kingdom. On the other hand, top 5 performing OIC countries in the EPI are Malaysia, Lebanon, Gabon, United Arab Emirates and Suriname, respectively (Table B.1 in Annex B). Malaysia ranked 9th in the EPI, showed better performance as compared to the other OIC Member Countries. The EPI results show that some developed countries such as France (12th), Japan (14th) and US (28th) are well behind the top performing countries. In general, the performances of the OIC Countries are not satisfactory.

Analysis of the relative performances of the OIC countries in each of the selected 6 policy categories (Environmental Health, Air Quality, Water Resources, Biodiversity and Habitat, Productive Natural Resources, and Sustainable Energy) within the EPI reveals that only Lebanon and United Arab Emirates have scores above 90 in the Environmental Health category (Table B.5 in Annex B). Malaysia, which is the best performing OIC country in the EPI, ranked 38th in overall environmental health scores. Thus, its performance in environmental health appeared to be slightly weaker than Lebanon and United Arab Emirates. It appears that there are only a few OIC countries that achieved significant performance in the EPI. In general, the performances of the OIC countries are not satisfactory in this category.

In Air Quality category, Uganda and Gabon with scores of 98 and 96.1 respectively are the top performers among the 133 countries (Table B.6 in Annex B). Togo has made comparable progress with respect to other countries and, consequently, ranks 10th. Malaysia's score for the same indicator was slightly below Togo's, although the former ranked 9th and the latter ranked 103rd in overall EPI scores. In general, the performances of the OIC countries are not satisfactory in this category either.

An overview of the performance of the OIC countries on the Water Resources shows that 12 out of the 44 OIC member countries have scores above 98 (Table B.7 in Annex B). These countries are Sierra Leone, Suriname, Gabon, Guinea-Bissau, Indonesia, Albania, Cameroon, Gambia, Guinea, Benin, Malaysia and Togo. Although there are number of OIC countries facing significant water problems, the overall performance of OIC countries in this category is relatively better.

In Biodiversity and Habitat, the OIC country with best performance is Benin (Table B.8 in Annex B). Burkina Faso, Uganda, Malaysia and Cote d'Ivoire, ranked 8th, 12th, 16th and 19th, respectively in this category. Wilderness protection target has not been fully met by any of the OIC countries including the top performers in this category. In Productive Natural Resources, Kazakhstan, Kyrgyz Republic, Azerbaijan, Turkmenistan, Uzbekistan, Tajikistan and Mali registered a score of 100 along with ten other countries (Table B.9 in Annex B). On the other hand, developed countries such as France, South Korea and US ranked 119th, 123rd and 124th, respectively, while Japan and Norway ranked at the bottom in this category.

The OIC country with the highest performance in Sustainable Energy is Uganda (Table B.10 in Annex B). It is also the top performing country in this category. The other top performing OIC countries are Mali, Chad, Guinea, and Burkina Faso as they ranked 2nd, 7th, 9th and 13th, respectively, in this category. In so far as their very low EPI scores are considered, Mali, Chad, Guinea, and Burkina Faso, (ranked 130th, 132nd, 113th and 126th, respectively), showed a comparably strong performance in this category, as they appear to be energy-efficient and they emit low levels of green house gasses (Table B.4 in Annex B). Mozambique, which ranked 121st in EPI, also showed remarkable performance, although it lacked in energy efficiency. In general, the performances of the OIC Countries are not satisfactory in this category.

4. Conclusions and Policy Implications

Environmental protection is becoming more and more challenging for a growing number of countries, including the OIC countries, as they lag progress in environmental sustainability. This important issue requires broader attention, as it will be difficult to promote economic development and environmental sustainability simultaneously in a growing number of countries. Low performances of some of the developed countries generate additional environmental challenges globally, and these challenges will make it more difficult for others to deal with the existing environmental pressures. To deal with these increasing pressures, there is an urgent need for a stronger commitment for environmental protection globally.

EPI scores outline the overall performance of a country in meeting the defined environmental targets and thereby help to improve policy making for achieving objectives on environmental sustainability. However, since the overall EPI results were obtained from scores in the main policy categories, it is important to focus on the indicators used accordingly. In spite of missing some critical indicators due to lack of reliable data, the Pilot 2006 EPI provides policy makers with appropriate policy options in producing better environmental results. Only few countries appear to have made substantial progress on many issues. It appears that most countries lag in their performance in biodiversity, energy and climate change, although they have achieved substantial progress on some of the other issues.

The EPI results reveal that progress of countries vary significantly in the selected categories. In particular, while the highest-ranking OIC countries had higher scores in environmental health, the lowest ranking countries showed a better performance in Sustainable Energy. On the other hand, Air Quality is observed to be an area of concern for most of the OIC member countries.

As the OIC countries face a mixture of environmental challenges, they will have to consider different policy options. The existing environmental challenges have to be handled in a systematic manner by first analysing the current environmental conditions to identify the problematic areas and then by taking appropriate policy actions.

Compared to the world average, it appears that the majority of the OIC countries are required to improve their performances in the Environmental Health, Air Quality, Water Resources, Biodiversity and Habitat and Sustainable Energy categories in order to achieve better environmental performance. Thus, the OIC countries need to enhance efforts in improving their performance in dealing with Child Mortality, Indoor Air Pollution, Drinking Water, Adequate Sanitation, and Urban Particulates (Environmental Health indicators), Regional Ozone concentrations (Air Quality indicators), Nitrogen Loading and Water Consumption (Water Resources indicators), Water Consumption, Wilderness Protection, Ecoregion Protection and Timber Harvest Rate (Biodiversity and Habitat indicators), Energy Efficiency, Renewable Energy, and CO₂ per GDP (Sustainable Energy indicators).

Lastly, it should be pointed out that existing data on many critical issues are far from a satisfactory level, and lack of data on important indicators is a significant obstacle for effective policy making in many OIC countries. Therefore, there is a need for the OIC member countries to initiate policies for addressing the data problems on environmental indicators. This process will not only increase the awareness of environmental sustainability but also the soundness of the policies for environmental protection in the OIC member countries.

Note: High scores indicate that the countries are closer to the target.

Table B.2: Cluster Analysis

	Cluster Groupings	Countries in Clusters
Cluster 1	It groups resource-rich countries with poor efficiencies and accordingly includes oil-rich countries from the Middle East and other East European and Central Asian countries with growing economies and significant water stress. These countries have fairly close targets for Environmental Health and Productive natural Resources indicators, but they are far from targets concerning Sustainable Energy and Biodiversity and habitat indicators.	Armenia, Azerbaijan , Bulgaria, Iran , Kazakhstan , Moldova, Oman , Russia, Saudi Arabia , Syria , Turkmenistan , Trinidad & Tobago, Ukraine, United Arab Emirates and Uzbekistan
Cluster 2	It groups countries that are moderately better than average across the board and accordingly includes Latin American and Asian countries with relatively intact natural systems but growing resource pressure. These countries are characterised by good water systems but poor air quality.	Bolivia, Brazil, Colombia, Costa Rica, Dominican Republic, Ecuador, Gabon , Georgia, Guatemala, Honduras, Indonesia , Jamaica, Kyrgyz Republic, Malaysia , Myanmar, Nepal, Nicaragua, Panama, Paraguay, Peru, Philippines, Sri Lanka, Suriname , Tajikistan , Thailand, Vietnam and Zimbabwe
Cluster 3	It groups countries that are moderately below average across the board and accordingly includes world's largest and most rapidly industrialising nations which face challenges of building environmental infrastructure as well as developing systems to control air and water pollution and protect ecosystems.	Algeria , Bangladesh , China, Egypt , El Salvador, Haiti, India, Mauritania , Mexico, Mongolia, Morocco , Pakistan , Romania, Tunisia and Yemen
Cluster 4	It groups countries with very low Environmental Health Scores and accordingly contains most of the least developed countries of Sub-Saharan Africa and a few from Asia.	Angola, Benin , Burkina Faso , Burundi, Cambodia, Cameroon , Central African Republic, Chad , Congo, Cote d'Ivoire , Democratic Republic of Congo, Ethiopia, Gambia , Ghana, Guinea , Guinea-Bissau , Kenya, Laos, Liberia, Madagascar, Malawi, Mali , Mozambique , Namibia, Niger , Nigeria , Papua New Guinea, Rwanda, Senegal , Sierra Leone , Sudan , Swaziland, Tanzania, Togo , Uganda and Zambia
Cluster 5	It groups wealthy countries with average Ecosystem scores and accordingly includes wealthy nations such as major European and major Asian economies as well as the US and Venezuela.	Cyprus, France, Hungary, Iceland, Israel, Italy, Japan, Jordan , New Zealand, Norway, Slovakia, Slovenia, South Africa, South Korea, Spain, Switzerland, Taiwan, United States and Venezuela
Cluster 6	It groups wealthy countries with above-average Ecosystem scores and accordingly comprises European countries with a few additional resource-rich countries.	Albania , Argentina, Australia, Austria, Belgium, Canada, Chile, Czech Republic, Denmark, Finland, Germany, Greece, Ireland, Lebanon , Netherlands, Poland, Portugal, Sweden, Turkey , United Kingdom

ANNEX C

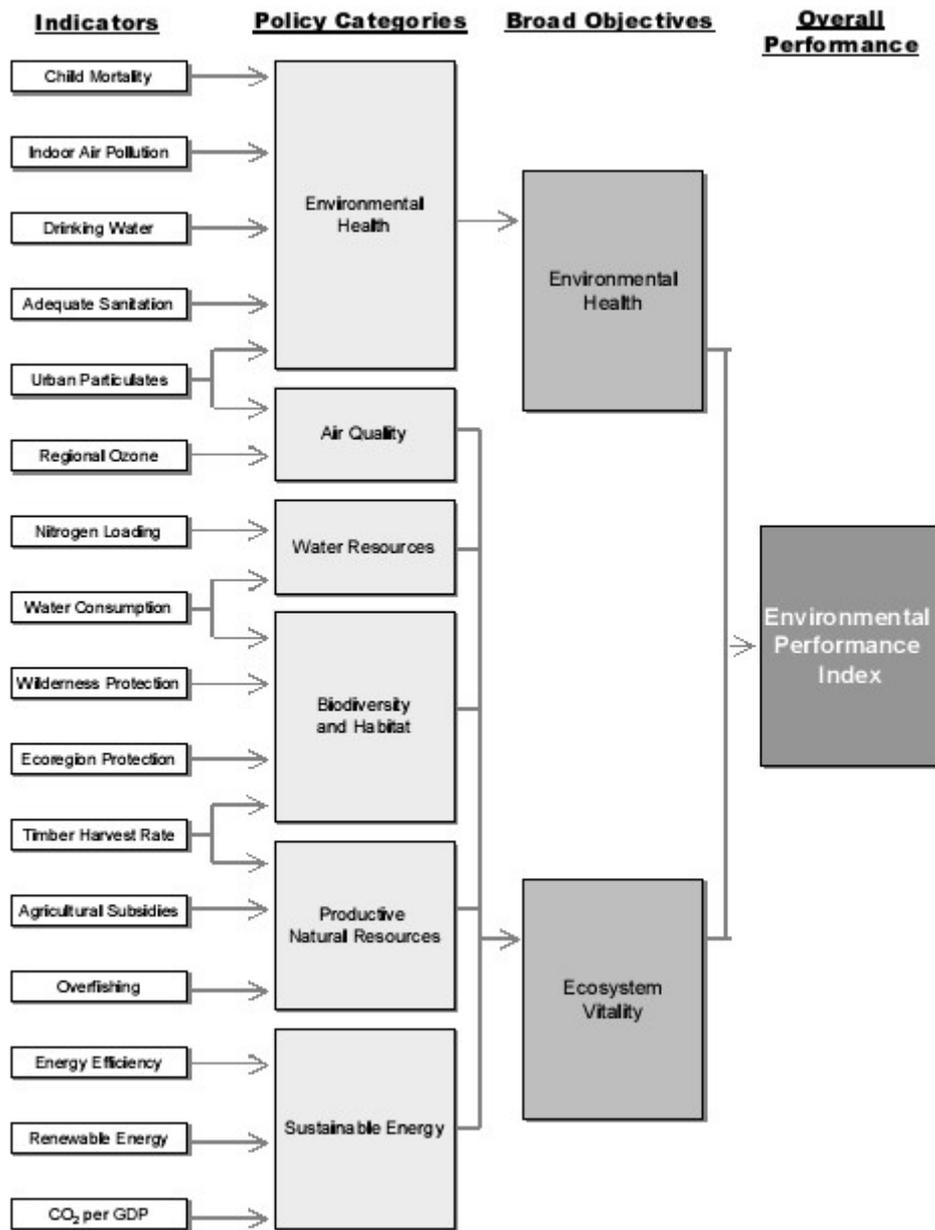

Introduction

Annex C presents profiles of OIC member countries, for which data is available. The country profile is a snapshot of each individual country, reflecting its performance within the Pilot 2006 Environmental Performance Index. In the box in the upper right hand side of the country profiles, EPI scores of each country as well as their overall rankings, income group averages and geographic group averages are shown. Country profile also includes a bar chart to reflect the performances of each of the OIC members on the six policy categories. The indicators used in the construction of policy categories are listed individually below the bar chart. These indicators include values, targets on the indicators used, and scores ranging from 0 to 100 to show how close the country is to the target. A score of 100 implies that the country has fully met the target, and a score of 0 indicates the worst performance in ranking the target.

A concise summary of the information regarding the EPI and its sub-components presented in the tabular form is also included. In this section, environmental performance of individual countries is analyzed in a comparative manner. In that respect, it compares the world average scores on each of the policy categories with those of each OIC country. This provides us with information in which category or categories the OIC countries performed better than the world average. In categories where a poorer performance was observed than the world average, indicators that led to this outcome were identified and referred to as priority policy areas for improving the overall performance of the OIC members.

Countries are listed in accordance with their overall EPI rankings in the following section.

Table C.1: Construction of the EPI

Malaysia, scoring 83.3, ranks 9th overall in the EPI and is the top performer among the OIC countries. Compared to the world average, it performs quite satisfactorily in terms of the Air Quality, Water Resources, Productive Natural Resources, Biodiversity and Habitat, and Environmental Health categories. On the other hand, in the category of Sustainable Energy, the performance level is not satisfactory. To improve performance in these categories, measures should be considered regarding Renewable Energy (Sustainable Energy indicators).

Morocco, scoring 64.1, ranks 68th overall in the EPI and among the top half performers among the OIC countries. Compared to the world average, it performs quite satisfactorily in terms of the Air Quality, Sustainable Energy, Biodiversity and Habitat, and Environmental Health categories. On the other hand, in the categories of Water Resources and Productive Natural Resources, the performance levels are not satisfactory. To improve performance in these categories, measures should be considered regarding Nitrogen Loading and Water Consumption (Water Resources indicators), Overfishing (Productive Natural Resources indicators).

Cameroon, scoring 54.1, ranks 100th overall in the EPI and among the bottom half performers among the OIC countries. Compared to the world average, it performs quite satisfactorily in terms of the Air Quality, Water Resources, Productive Natural Resources, Sustainable Energy, and Biodiversity and Habitat, categories. On the other hand, in the category of Environmental Health, the performance level is not satisfactory. To improve performance in these categories, measures should be considered regarding Child Mortality, Indoor Air Pollution, Drinking Water, Adequate Sanitation, and Urban Particulates (Environmental Health indicators).

Nigeria, scoring 44.5, ranks 123rd overall in the EPI and among the bottom half performers among the OIC countries. Compared to the world average, it performs quite satisfactorily in terms of the Air Quality, Water Resources, and Sustainable Energy categories. On the other hand, in the categories of Productive Natural Resources, Biodiversity and Habitat, and Environmental Health, the performance levels are not satisfactory. To improve performance in these categories, measures should be considered regarding Overfishing (Productive Natural Resources indicators), Wilderness Protection, and Eco-region Protection (Biodiversity and Habitat indicators), Child Mortality, Indoor Air Pollution, Drinking Water, Adequate Sanitation, and Urban Particulates (Environmental Health indicators).
