STOCK EXCHANGE ALLIANCES AND A MECHANISM FOR COOPERATION AMONG THE OIC MEMBER STATES IN THE AREA OF FINANCIAL MARKETS

SESRTCIC

Stock exchanges are instruments aiming to mobilise financial resources to facilitate their optimal utilisation in profitable investment projects. Particularly in the case of the developing countries, which are very much in need of funds to finance their development projects, the role of stock exchanges becomes much more important. On the other hand, mainly due to the rapid advances in information and communications technology, the mobility of financial flows around the globe increased enormously. As a result, capital and financial markets in distant locations have found themselves in a severely competitive environment. Some stock exchanges had to respond to these developments by increasing cooperation among them. In line with these developments, the present paper discusses the necessity of increasing cooperation among the emerging stock exchanges in the OIC countries and proposes a mechanism for cooperation among them in the area of financial markets.

1. INTRODUCTION

Globalisation and the rapid integration of world markets have been most evident in world capital and financial markets\(^1\). They have also been the main forces driving the process of change in those markets. With globalisation, major institutional investors have moved massively into portfolio and equity investment on a cross-border or global basis.

To cope with the recent global transformation, financial and capital markets have been engaged in a rapid process of change to secure and consolidate their positions and to face up to the challenge posed by globalisation. Stock exchanges too, as integral institutions in international finance, have been going through a similar process of adjustment. The

\(^1\) Regulated markets and any other securities and derivatives markets recognised, regulated or supervised by the authorities.
different forms of stock market alliances that have been taking place recently are among those adjustments. Alliances take the forms of mergers and take-overs in some instances, and unions and federations in others. The form, rigour, speed and volume of change invariably reflect the level of advancement and organisation of the stock markets themselves besides the state of development of the host economies.

Since a stock exchange is a regulated market involving different actors and mechanisms, it plays a crucial role in developing financial markets. Stock exchanges broaden investment opportunities around the world. Nonetheless, some constraints exist for them. In this context, stock exchanges worldwide are faced with challenges to provide a high-quality service to market participants like intermediaries, market organisers, companies and investors. Moreover, public and private agents in their jurisdictions play an important role in strengthening the ties between them.

On the other hand, in today’s world, markets in America, Europe and the Asian/Pacific rim dominate the world’s financial markets. Essentially, the three regions carry roughly the same weight. For others, however, to have a foothold in these increasingly integrated and concentrated markets, there is a need that they cooperate among themselves and form their own alliances.

Forming alliances and establishing links among stock exchanges can be done through a variety of ways and means. Mostly, mechanisms depend on the functionality and capacity of existing stock exchanges to provide those links. Furthermore, infrastructure providers, such as energy and telecommunications utilities and the banking sector, play a crucial role in supporting those mechanisms. On the other hand, forming alliances and establishing links among stock exchanges lay important responsibilities on the shoulders of the competent authorities in the member countries. This includes the creation of a regulatory framework for supervising those markets and making the necessary changes in the national legislation. In this regard, the harmonisation of physical, institutional and legal frameworks plays a key role in consolidating those markets in the participating countries.

Moreover, stock exchanges in member countries should adopt a common set of rules and standards in listing companies, clearance and
settlement processes, and require listed companies and market intermediaries to comply with them.

The examination of methods and mechanisms pursued by existing regional alliances of stock exchanges will be a suitable starting point in seeking a mechanism to establish a union of Islamic stock exchanges and clearing houses. For this reason, this report starts by surveying the experience and structure of the current international stock exchange alliances with the purpose of drawing lessons from which the proposed OIC alliance could benefit. The samples of institutions considered are the most reputable and influential worldwide. They also represent a real cross-section of the current spectrum of institutions working in the world today. Thus, together, they represent an abstract of contemporary human experience in this field. Based on their experiences, the OIC countries may discuss the feasibility of these alternative models and agree on a possible mechanism in this regard.

This report was prepared in line with Resolution No. 38/30-E, adopted at the Thirtieth Session of the Islamic Conference of Foreign Ministers, held in Tehran on 28-31 May 2003, which requested that the studies on creating a mechanism for cooperation among the OIC Member States in the areas of financial markets and clearing of stocks and bonds should not lead to the creation of any new bodies but the activation of existing mechanisms in these fields.

Under this new guidance, the Ankara Centre reconsidered its earlier study on a possible establishment of a Union of Stock Exchanges and Clearing Houses and attempted to formulate a mechanism for cooperation among such institutions in the OIC member countries without creating any new bodies but through the activation of existing mechanisms in these fields.

The present Report is structured as follows: Section two gives a general background on the matter introducing basic concepts and the logic and functions of stock exchange alliances. Section three contains a brief description of the selected international stock exchange alliances and their structures and operation procedures. Section four briefly discusses mutual trading models among securities markets, and Section five proposes a mechanism for cooperation among such institutions in the OIC member countries without creating any new bodies but through the activation of
existing mechanisms in such fields based on the material discussed in the previous sections.

A statistical annex\(^2\) is included to reflect the state of development of the main OIC capital markets vis-à-vis developing, emerging and developed markets.

2. BACKGROUND

Stock exchanges and clearing houses have been among the basic and central institutions of capital and financial markets which also perform the most central role and functions of an economy. The two institutions were created during the last century as vehicles and intermediary bodies through which investors meet and interact. In addition to their conventional objectives, contemporary exchanges perform many more functions than the ones for which they were originally contrived.

Stock exchanges are specialised, centralised and organised markets designed purposely for the trading of the financial securities listed within them. They may be of two kinds: incorporated institutions or voluntary associations of members. In either case, however, they include a legal framework, a constitution, a charter, by-laws, and rules and regulations that govern their membership, listing, trading and other organisational and operational matters. Exchanges do not trade in the listed securities; they merely provide the facility for trading. They are institutionally justified by their function of facilitating marketability in their listed securities. This is done by providing trading facilities and publicity to volume and prices, and by requiring the corporations whose shares are listed to observe proper standards of accounting and reporting, thus enhancing public confidence in the market and in its listed securities (Glenn 1984, p.893).

The most essential function of stock exchanges is, as it has always been, to offer the owners of enterprises the opportunity to raise new capital and, hence, build substantial joint companies. The capital of enterprises represents the savings of individuals. Exchanges provide the investor with the means of investing his or her savings whilst retaining

---

their liquidity. Savings of individuals are precious and it is necessary that they be protected. Exchanges, therefore, include in their functions the publication of timely information from issuers so that investors can be properly informed about the enterprises in whose securities they invest and the process whereby prices for those securities are struck. It is therefore essential, both for fairness and economic efficiency, that all exchange functions, including the setting of stock prices, be determined in a transparent way. Therefore, the central functions of stock exchanges revolve around adapting the conventional roles of stock exchanges to the challenges posed by technology and the globalisation and institutionalisation of markets.

Stock Clearing Establishments or Houses (SCHs) are corporations often formed by the members of a stock exchange to provide them with facilities of clearing transactions in securities, including netting out contracts between members, delivering securities and handling payment for them (Walmsley 1979, p.234). All leading and fully-developed exchanges in the world have their own clearing houses and mechanisms. However, some exchange markets do not have these and use, instead, other leading markets’ SCHs as standards and vehicles for their operations.

The process of settling a transaction is closely related to the functioning of clearing and settlement systems. Once the terms of a securities transaction are confirmed, the respective obligations of the buyer and seller are established and agreed. This is part of a series of steps involved in the process of completing the transfer of ownership of the securities and the corresponding payment.

The delivery of securities and payment of funds may occur simultaneously, but only when both delivery and payment have been finalised, the settlement of the securities transaction is completed. Essentially, for a settlement to occur, the following steps need to be accomplished (EU’s Web Site, 2001, p.4):

- **Confirmation** of the terms of trade as agreed between the seller and the buyer;
- **Clearance**, by which the respective obligations of the buyer and seller are established;
**Delivery**, requiring the transfer of the securities from the seller to the buyer.

**Payment**, requiring the transfer of funds from the buyer to the seller.

Settlement is a service normally provided by a clearing house, a Central Securities Depository (CSD) or an international CSD (ICSD), when there is not any established clearing system and/or mechanism in the country. A Central Securities Depository immobilises physical securities and transfers their ownership by means of book entries in electronic accounting systems. In some cases, a Central Counter-Party (CCP) interposes itself between buyers and sellers, becoming, in effect, a buyer to every seller and a seller to every buyer, which is known as novation. In this case, both buyer and seller should be members of these systems.

Clearing and settlement institutions may also operate in various locations as modern technology makes it easily possible. Similarly, direct remote access to national clearing systems is also technically possible if it does not face any barriers (EU’s Web Site, 2001, p.59). However, as more intermediaries are involved in this process, securities transactions become more complicated and linked to the international settlement and payment systems and mechanisms. As a result, close cooperation among the stock exchanges and clearing systems becomes a necessity and mergers or alliances are formed for that purpose.

Stock exchange alliances are associations, federations or unions of stock exchange markets formed with the main purpose of promoting business through cooperation, harmonisation and integration. Contemporary stock exchange alliances range from loose representative bodies to fully integrated ones. Between these two extremes lies a series of other combinations with varying degrees of cohesion and rigour. Often the names these institutions take – viz., Association, Federation, and Union – are indicative of the strength of their institutional relationship.

These differences are mostly a reflection of the differences between the allying markets and the countries in which they are based. It is generally the case that where markets and the countries in which they are based are highly integrated or prone to integration, their market alliances are also more integrated.
In the next section, some recent examples of the different forms of stock exchange alliances are given in detail. This detailed account of the most important existing exchange alliances is to serve as a model for the Islamic Stock Exchange Federation or Union.

3. STOCK EXCHANGE ALLIANCES

The need for international cooperation among stock exchanges was first felt in the 1930s. The International Chamber of Commerce, based in Paris, took the initiative to create an International Bureau of Stock Exchanges which existed until World War II. After the War, it was not until 1957 that the first major steps towards international cooperation between exchanges took place and, in May of that year, representatives of several European bourses met in Paris. Four years of informal cooperation followed after which the participants chose to institutionalise this work in the form of a federation. Thus, the International Federation of Stock Exchanges was established in London in 1961.

International Federation of Stock Exchanges (FIBV)³

Since its establishment in 1961, the International Federation of Stock Exchanges has grown constantly. Today, its membership encompasses 56 regulated exchanges from all over the world. FIBV members together account for over 97% of the world stock market capitalisation and most of its exchange-traded futures, options, listed investment funds, and bonds. There are also 9 more affiliate exchanges and 35 correspondent bourses.

Purpose and goals

La Fédération Internationale des Bourses des Valeurs (FIBV) is the trade organisation for regulated securities and derivative markets and related clearing houses worldwide. It is an international organisation comprised of the world’s leading exchanges that are committed to the highest levels of market quality.

It provides a forum for communication, analysis and debate among members. Its purpose is to facilitate the representation and development

³ www.fibv.com
of organised and regulated markets and meet the needs of evolving capital markets in the best interest of their users. Since its foundation, the FIBV has regularly held committee meetings, general assemblies, and conferences. In recent years, it has also organised specialised workshops for its members to transfer know-how and share expertise. It discusses virtually every aspect of the securities business, be it technical, commercial, legal or economic. Over the past four decades, studies have been published on such issues as self-regulation, enforcement, trading halts, securities business conduct, and others.

The label “Member of FIBV” identifies each market as having prescribed business standards, recognised as such by members, owners, and users of exchanges as well as by regulators and supervisory bodies. Organised and regulated financial markets do the best economic job of allocating capital on the largest possible scale. From capturing orders to trade or providing access to new company capital offerings and then carrying on through trading, reporting, settlement and custody, FIBV member markets have developed sound business practices offering investor protection and efficient price discovery. New technologies and competition stimulate FIBV members to make their services more efficient, cost-effective, user-friendly and reliable. Sharing of business experience and knowledge among FIBV member exchanges is critical to the development of the industry, especially that financial market operators offer services in an increasingly competitive environment.

The FIBV is a central reference point for the securities industry and, for the exchanges themselves, the market of choice. It offers member exchanges guidance in their business strategies and in the improvement and harmonisation of their management practices. The FIBV also works with public authorities and helps promote the increased use of markets. The FIBV’s main goals are:

- To demonstrate the role, functioning and integrity of regulated markets;
- To maintain a platform for securities markets professionals to discuss issues of common interest, identify new approaches and solutions which enhance the competitive position of regulated markets, and develop programmes which support stock exchange
operations, including research papers, workshops, benchmarking and best practices;

- To establish harmonised standards for business processes in trading securities, including cross-border trading;

- To deepen the co-operative relationship with supervisory authorities in order to advocate the benefits of stock exchange front-line self-regulation within the total regulatory framework; and

- To support emerging exchanges in their efforts to develop markets which function according to FIBV member standards, thus contributing to global respect for the business practices of a well-run industry.

To achieve these goals, in addition to the activities mentioned earlier, the FIBV publishes a monthly newsletter, statistics bulletins and other publications on member exchanges. It also maintains statistical and information databases to keep historical records on members.

**Federation of European Securities Exchanges (FESE)**

Europe constitutes one of the most stable regions of the world. The European countries are amongst the wealthiest and economically most vibrant. The attractions of Europe for capital seeking profitable employment remain potent. High savings rates ensure that Europe remains at the same time a significant source of capital for other parts of the world.

The Federation of European Securities Exchanges (FESE), formerly called the Federation of European Stock Exchanges, is the Brussels-based Association of Europe’s Investment Services Directive (ISD) authorised stock exchanges, futures and options markets and clearing organisations. The Federation represents the voice of Europe’s regulated and supervised market operators towards the authorities, especially at the EU level. The Federation’s membership is open to all regulated and supervised market organisations in the EU, Norway, Iceland and Switzerland as well as in

---

4 Formerly known as the Federation of European Stock Exchanges; see www.fese.be and www.fese.org.
the countries seeking accession to the European Union. The Federation is, therefore, also open to new market organisations that are subject to EU financial securities market legislation.

The Federation represents 27 stock exchanges across Europe. Additionally, 6 stock exchanges are its associate members and 4 are correspondents. The term ‘correspondent’ stock exchanges applies to leading market operators that are either not ready to apply for associate membership or are from countries not yet in formal negotiations to join the EU (FESE’s Web Site). It is a loose federation of stock exchanges.

The new FESE represents a leap forward over its predecessor, the Federation of European Stock Exchanges, as it includes also futures and options markets and clearing houses. This new format of the FESE may be the most suitable model to be followed by the proposed Islamic federation. However, it is at a rather advanced stage, which may require a great deal of cooperation and harmonisation. It took Europe the best of the last two decades to reach this stage, and there is still some way ahead before Europe reaches its intended level of cooperation in this field. Accordingly, it may be advisable for the proposed Islamic Union to follow a phased process similar to that of Europe, starting first with a loose federation of Islamic stock exchanges.

**Purpose and goals**

The Federation exists to reflect and represent the common interests of European exchanges as regulated securities markets. Broadly stated, its objective is to contribute in the field of securities and financial markets to the attainment of the aims of the Treaty of Rome. It seeks to promote the development of the securities markets in Europe by co-operating in the areas of trading, clearing, settlement and deposit of securities as well as regulatory matters. The Federation co-operates with other international organisations, in particular the institutions of the European Union, and acts as a representative voice of its member exchanges in matters of concern to the European securities industry. In so doing, the Federation furthers the gradual process of integration of the European capital markets.

The Federation serves first as a forum in which exchanges discuss the needs of market users and look for agreement as to how those needs are to be met. The statutes of the Federation envisage not simply debate,
but also joint action to create the infrastructures needed for efficient markets in Europe. In these discussions and activities, all member exchanges contribute to finding common solutions.

A continuing role of the Federation is to be a representative voice of the member exchanges in relation to the European Union institutions—principally the European Commission. Moreover, the Federation promotes a number of projects designed to further the effectiveness of the equity markets in Europe. These include:

- **The implementation of the EU Investment Services Directive**
  This Directive, which confers the “European passport” on properly authorised investment firms, brings about major changes in national securities regulation. The exchanges will be an important part of the regulatory machinery after the directive is implemented and, through the Federation, the exchanges are studying the ways in which they can contribute to its effective and consistent implementation.

- **Linkages between exchanges**
  Member exchanges have agreed that the process of integration should be taken forward through bilateral and regional linkages facilitating and enhancing cross-border trading. The Federation provides the forum in which strategies and methodologies can be discussed and agreed.

- **Assistance to emerging markets**
  The newly founded market institutions in the countries of Central and Eastern Europe are urgently in need of assistance—technical, legal and professional. The Federation plays a vital role in coordinating the provision of such assistance.

- **Economic studies**
  The Federation publishes a monthly review of statistics of stock exchange activity in its member exchanges, which forms the starting point for those who follow European trends. The Federation has taken the lead in forming an institute, the European Capital Markets Institute, which undertakes extensive studies on the efficiency of the capital markets of Europe.
In the past decade, European stock exchanges have undergone a process of transformation. Most have been “deregulated”, i.e. freed of the restraints and conditions that were normal for a largely national domestic role. Exchange membership is available to foreign-owned intermediaries, and many securities are multi-listed.

Building on their traditional strengths, the European exchanges now provide markets which function throughout the day, whereas trading used to take place only during a short session or at a single fixing. They also provide order routing for swiftness and sureness of execution at a low transaction cost. They provide transparency—enhanced by the technical possibilities now available. Exchanges have been amongst the most creative users of information technology.

Exchanges have adapted their regulations and dealing procedures to improve the liquidity in their markets. Techniques including market making, block trading and the introduction of inter-dealer brokers have all served to meet the demands for liquidity brought by the institutions. At the same time, the pricing of securities is made on a fair and transparent basis.

The explosion of cross-border trading and investment has brought additional risks into the markets. Therefore, the exchanges have had to refine the handling of orders and the execution of business so that settlement periods are reduced in length and safety of trading and settlement becomes common practice.

Then, recognising their prime role in the provision of capital for industry, many exchanges have paid special attention to the needs of growing enterprises in setting up special market sectors designed to suit the needs of smaller companies.

In a press release\(^5\), the FESE:

- Calls for a thorough review of the Investment Services Directive (ISD) and proposes a functional approach to the regulation of market operators. Europe’s exchanges demand a level playing field for all market operators.

• Recommends strongly the installation of a Securities Committee and a Regulatory Committee under the ISD and argues that such committees can only be successful when market experts and industry are closely involved in consultation procedures.

• Demands again the opening of US markets for the activities of European securities markets and presses for the immediate opening of a dialogue with the US authorities.

• Finds that the organisation of clearing, settlement and depository service provision is not an area for top-down imposition of a structure; these areas should be left to the interplay of market forces.

Priority is given by FESE to a thorough review of the Investment Services Directive (ISD), the “Constitution” of securities legislation in Europe. A functional regulation of market operators, a level playing field for all types of market operators and the effective implementation of the single passport principle for investment firms, issuers, and markets are needed for Europe's financial markets to remain competitive. FESE would see merit in a split-up of the heterogeneous ISD into an investment-firm-related directive and a markets-related one.

Europe’s exchanges stand ready to support further efforts to streamline cross-border clearing and settlement in Europe. This area, however, is not seen as one where the structure should be imposed by regulators. The interplay of market forces should be allowed to lead to solutions beneficial to investors, intermediaries and issuers.

**Federation of Euro-Asian Stock Exchanges (FEAS)**

The Federation of Euro-Asian Stock Exchanges (FEAS) was established in 1995 on the initiative of the Istanbul Stock Exchange. The headquarters of the Federation is in Istanbul, Turkey. All twelve founding members are exchanges of emerging markets in Europe and Asia at different stages of development. Membership is open to exchanges located in Europe and Asia subject to approval by the General Assembly. Currently, there are 22 member exchanges.

---

6 [www.feas.com](http://www.feas.com).
representing more than 9,000 traded companies and a market capitalisation of over 130 billion US dollars on an average daily traded value of over 500 million US dollars. Fifty percent of current FEAS membership is from OIC Member States.

The mission of FEAS is to create a fair, efficient and transparent market environment with little or no barriers to trade between its members and their operating regions. For this purpose, it aims to further cooperation and communication among its members in such areas as standardisation and harmonisation of rules and regulations, trading systems and settlement procedures, listing criteria and adopting internationally accepted accounting principles. Its objectives are as follows:

- To encourage cooperation among member stock exchanges in order to promote the development of securities markets;
- To act as a representative voice of the members vis-à-vis the federation and associations of stock exchanges in the world;
- To promote the development of more integrated international stock exchanges in the region and offer listing and trading opportunities for securities issued in the region.

The harmonisation of rules and regulations and the adoption of new technologies for trading and settlement by member securities markets are also expected to contribute towards the Federation’s objectives by promoting the development of the member markets and providing cross listing and trading opportunities for securities issued within its member countries.

**South Asian Federation of Exchanges (SAFE)**

The South Asian Federation of Exchanges was launched in January 2000 in Chittagong by South Asian stock exchanges from Sri Lanka, Pakistan, Nepal, India, Bhutan and Bangladesh. All securities exchanges in the South Asian region may be eligible for membership. The preamble of the Chittagong Declaration states: “Globalisation has increased the interdependence among nations and simultaneously

---

7 www.safe-asia.org.
regional cooperation forums have emerged or are emerging. Therefore, stock exchanges around the world are co-ordinating their various initiatives and forming regional federations on the regional cooperation philosophy. The immediate objectives of such federations are to enhance communication and to standardise operation procedures. Long-term objectives may include cross-border listing”. The Federation is to work on a charter stating its objectives, scope of work, organisational structure and features, and procedure of decision making.

The main objectives of the SAFE are:

- To encourage cooperation among members in order to promote the development of their respective securities market;
- To work towards common standards, best business practices in members’ securities markets and effective surveillance of international securities transactions;
- To represent the members in related international forums;
- To encourage cross-border listing and trade in the region;
- To co-operate in human resource development and transfer of technology;
- To provide investment opportunities for all groups of people;
- To develop a strong platform for entrepreneurs for raising capital;
- To develop a transparent market ensuring investors’ interest;
- To provide a fully automated trading system to ensure quick, easy and accurate transactions.

The Federation also provides services to its members in the fields of information, research and technical cooperation. Since information on business and markets is very important for any cross-border operation, the Federation gathers data from the members and processes them into a
standardised format so that they are comparable to a desired level. It disseminates them routinely among the members. The Federation acts as a catalyst for the introduction of standardised procedures and the expansion of the markets. It provides expert advice to the member exchanges for their own and integrated development in the light of international modern practices. Furthermore, it organises conferences and seminars on relevant topics relating to the regional and world markets and arranges executive exchange programmes.

**African Stock Exchanges Association (ASEA)**

The African Stock Exchanges Association was incorporated in 1993 in Kenya. Its main aim is to provide a formal framework for the mutual cooperation of stock exchanges in Africa through various processes encompassing the exchange of information and assistance in the development of member exchanges. The ASEA has the following objectives:

- To provide a formal framework for the mutual cooperation of stock exchanges in Africa through various processes encompassing the exchange of information and assistance in the development of member exchanges;

- To assist members in the establishment of stock exchanges, development of financial instruments and promotion of stockbrokers and dealers;

- To develop and establish standards of training and professionalism amongst stockbrokers and dealers, and personnel associated with members;

- To develop and establish standards of listings, maintenance of listings, and issuing, trading and settlement of securities;

- To assist members in the development of self-regulation to the greatest possible extent and assist members in representations to the national and international bodies in this regard;

---

8 Information for Africa (Mbendi), www.mbendi.co.za/orgs/cdkp.htm.
• To assist members in the promotion and development of services associated with the capital markets;

• To promote and develop the establishment of a data bank and information system for the mutual benefit of members; and

• To study, research and investigate matters of interest to members.

Southern African Development Community (SADC) Exchanges’ Committee

The SADC Committee of Stock Exchanges was formed in January 1997 as a private-sector initiative within the SADC framework. Its membership is open to all member countries of the SADC. Member countries with established exchanges include Botswana, Malawi, Mauritius, Mozambique, Namibia, Swaziland, South Africa, Tanzania, Zambia and Zimbabwe.

Its main objectives are:

• To maintain and improve market integrity in order to have markets that are fair, efficient and transparent with proper price discovery;

• To increase liquidity of trading in equities, bonds, derivatives and other financial instruments;

• To enforce legislation and rules and protect market participants and investors;

• To make the SADC securities markets more attractive to local and international investors;

• To raise capital for the regional economic development;

• To improve the operational capacity of SADC stock exchanges;

• To advocate and lobby for private-sector-led regional market integration;

• To build cooperation between SADC stock exchanges and their regulators;
To establish a forum through which the SADC region policy makers can consult the region’s existing securities markets before planning further developments in this field.

To this end, the Committee advocates the policies and strategies which build upon the concepts of harmonisation and rationalisation of operations to be applied where appropriate. Accordingly, exchange of information, expertise and experience will form a significant part of the process.

**Federacion Iberoamericana de Bolsas de Valeores (FIABV)**

The FIABV was created in Rio de Janeiro, Brazil, on 27 September 1973. Member countries with regulated stock exchanges include Argentine, Brazil, Chile, Colombia, Costa Rica, Ecuador, El Salvador, Spain, Mexico, Peru, Portugal and Uruguay.

Its main objectives are as follows:

- To foster cooperation among its members in order to promote the development and advancement of their securities markets in the best interest of all market participants;

- To cooperate with national and international entities having legislative, regulatory or other functions in respect of financial and securities markets with a view to ensuring homogeneous standards and regulations as to handling securities operations, trading, issuers, brokers, securities markets, securities depositories and custodians;

- To promote the integration of the Federation’s stock markets, stimulate inter-activity of market participants as well as secure the free circulation, within their respective jurisdictions, of securities issued in any of its members’ home country; and

- To encourage the establishment of rules and procedures ensuring solvency, competence, legitimacy and fair information disclosure to all savers investing through member exchanges.
EURONEXT

The Euronext stock market, which is the first European stock exchange, was created in September 2000 by the merger of the Amsterdam and Brussels Exchanges and the Paris Bourse. Euronext is the driving force behind the consolidation process in the European capital markets and builds on the strength of the Amsterdam, Brussels and Paris Exchanges. It was created in response to a growing demand from the market—favourable climate to achieve further consolidation in the European capital market—and to meet the need for greater liquidity and lower costs resulting from the introduction of the euro.

It has the biggest market capitalisation in Euroland (51% of the total), the biggest commodities exchange in Europe and is the number one exchange for options. It is also a truly international merger with transnational business units, transnational management and transnational shareholders and members.

Euronext is not only a merged entity, it is also an open venture. It conducts its business through three separate operators: Euronext Amsterdam, Euronext Brussels and Euronext Paris. These three operators and their regulated markets are subject to local requirements governing the official stock exchange status.

The Euronext intends to promote capital markets in Europe and set global standards for financial markets in the fields of information, trading, clearing and settlement services. It also intends to form alliances for the benefit of an efficient and enlarged European capital market. Furthermore, it aims to deliver quality and competitive services to clients, intermediaries, investors and issuers. In this regard, the Euronext has replaced floor trading with screen trading, and built a fully-integrated exchange encompassing listing, trading, netting, clearing and settlement. Following the footsteps of its constituting three predecessors, the Euronext is a member of the Federation of European Securities Exchanges (FESE).

NOREX

The NOREX is a strategic alliance between Nordic stock exchanges with the aim of offering investors, issuers and members a cost-effective and

---

high-quality Nordic securities market. It covers a wide range of investment opportunities. The alliance is based on the principles of cross membership, a common trading system and a common regulatory framework.

To that effect, member stock exchanges of NOREX have created the possibilities for efficient cross-border trading, but a common system for settlement is still missing. Nonetheless, the market demands for a single system of clearing and settlement are to be met through an integrated approach. The alliance also aims to harmonise rules, regulations and requirements among the stock exchanges with respect to trading and membership.

4. MODELS OF MUTUAL TRADING AMONG SECURITIES MARKETS

Cross Listing

Cross listing is the admission for listing/trading of securities, which are already listed on a local stock exchange, on foreign stock exchanges. Cross-listed securities will be subject to the rules and regulations of the local exchanges. Although cross listing is subject to the preference of companies, stock exchanges may facilitate it by opening their markets to the securities listed in other exchanges on a correspondence basis.

Cross Membership

Cross membership is accepting the members of other stock exchanges for membership. It is a means for the intermediary institutions to access foreign stock exchanges directly. There are two alternative systems to be pursued for cross membership. One is remote membership and the other buying or selling through a brokerage house in the country where the trading takes place.

For a remote membership, the Central Securities Depository (CSD) opens both cash and securities accounts for remote members or for their home country’s CSD in the settlement systems of the host country where the trading takes place (See Table 1). Moreover, a cash correspondent relationship can be established in case of necessity. On the other hand, a uniform and standard custody agreement for this purpose is suggested to be adopted in order to ease the problems that might occur as a result of
different market practices. Essentially, settlement members are foreign brokers or their home country’s CSD. The settlement of securities and payment is realised by the CSD of the country where the trading takes place.

### Table 1: Trading Under Cross Membership

| A) Remote Membership | CSD opens both cash and securities accounts for remote members or for their home country’s CSD in the settlement system of the country where the trading takes place. |
| Settlement members | Foreign brokers or their home country’s CSD. |
| Settlement of securities and cash | It is realised by the CSD of the country where the trading takes place. |

| B) Buying or selling through a brokerage house in the country where the trading takes place | Foreign brokers can directly trade through a local broker in the country. |
| Settlement members | Local brokers. |
| Settlement of securities and cash | It is realised by the CSD of the country where the trading takes place. |

On the other hand, in case of buying or selling through a brokerage house in the country where the trading takes place, foreign brokers directly trade through a local broker in the country (See Table 1). Although the latter is a direct party to the settlement, in case of default, foreign brokers or their stock exchange or settlement institution are accepted as responsible for the fulfilment of due obligations. For this purpose, an agreement is signed between local and foreign brokers together with both brokers’ stock exchanges and settlement institutions. Essentially, settlement members are local brokers. The settlement of securities and cash is realised by the CSD of the country where the trading takes place.

### Common Trading Platform (CTP)

The Common Trading Platform (CTP) is a central trading platform that will be created in order to enable the securities of the companies in member country jurisdictions to be traded collectively in accordance with the principles established by the participating stock exchanges. These principles consist of special rules that make up the legal, organisational and technical infrastructures of the trading platform. There are two alternative approaches used for it.
In the first approach, a CTP provides a centralised system where it is administered by an executive committee consisting of the representatives of the participating stock exchanges and operated by a CTP operator. In this case, the CTP operator will be located in one of the participating countries and will be a legal entity or a stock exchange within the jurisdiction of a member country. However, by pursuing this model, the existing systems for the local markets will be preserved while the participating stock exchanges will jointly design a new trading system to be used for the CTP.

The other approach used is a CTP providing an order routing system without having to establish a centralised system. In this model, a new trading system will be adopted by the participating stock exchanges or a common interface will be installed among them. Thus, the CTP may be jointly operated by all the participating stock exchanges and will be a legal entity.

Moreover, regardless of whether it is a centralised or decentralised model, settlement members in case of a CTP are brokers and local custodians or Central Securities Depositories (CSDs) of member countries. However, this may create risks as a result of the increased number of institutions involved in these transactions. On the other hand, local rules and regulations in some countries may not allow a CSD to become a member of such systems. In addition, the settlement risks of brokerage houses can also create problems for the CSDs.

5. PROPOSED MECHANISM FOR COOPERATION IN THE AREA OF FINANCIAL MARKETS

Current Situation

As in the experiences discussed above, the proposed model for the OIC exchange alliances will essentially depend on the state of development in the main OIC markets. A rough picture in this regard is reflected in this paper’s Statistical Annex. The four tables in the Annex reflect the OIC stock exchanges’ state of development vis-à-vis developing, emerging and developed markets. The criteria used by the International Finance Corporation (IFC) in these comparisons are the levels of capitalisation (Table 1), value traded (Table 2), and number of listed companies (Table 3). According to these three criteria, Table 4 shows the OIC markets that appear in the top forty markets in the world.
Lessons and Insight

From the various existing models discussed previously, the following insights and lessons can be inferred:

1. The proposed OIC alliance might be a full merger or union such as Euronext, a tight federation modelled on FESE or a rather looser federation such as FEAS or SAFE. Another option for the proposed alliance is to create a platform such as the FIBV which serves only as a representative and meeting body with some common resources and services that are shared between members.

2. The full merger or the tight alliance options may be the best to serve the purposes of more integrated cooperation schemes. However, such a scenario requires firm and strict conditions, high integrability and analogous levels of development among such institutions and a considerable degree of homogeneity and harmonisation between the economic policies of the member countries. Therefore, it is not practical at the beginning for an OIC-wide cooperation, but is plausible and probably best for smaller regional or sub-regional OIC groups such as the Gulf Cooperation Council (GCC).

3. The other federation models could serve as models for OIC cooperation in this area. However, since these models, whether tight or loose, necessitate the creation of a new body within the OIC system, they do not satisfy the criteria laid by the 30th ICFM.

4. Therefore, this paper recommends that the OIC cooperation in this area begin with the creation of a common platform which serves only as a forum for cooperation, communication, exchange of views and discussion on the OIC financial markets.

5. On this platform, presidents and/or CEOs of the stock exchanges from OIC member countries may come together to discuss the common problems facing the financial and capital markets in the OIC countries and exchange views and expertise on the necessary steps for mobilising internal financial resources,
facilitating the optimal utilisation of such resources in investment projects or developing their stock markets.

6. At the beginning, the platform may be open only to the authorised and regulated stock exchanges in the OIC member countries. But later on if they deem it necessary, they may gradually invite other financial institutions that are engaged in issuing, trading, listing, clearing and transferring of stocks and securities as the member stock exchanges and other financial markets mature through time.

**Proposed Platform’s Goals and Objectives**

The main objective of such a platform would be to foster cooperation among the OIC member countries in the area of financial markets in order to mobilise financial resources within the OIC community, channel them into local investment projects and develop their capital markets, in particular stock exchanges, so as to prevent the flight of capital. For these objectives to materialise, the platform would help create a proper environment for cooperation among the member stock exchanges which, in turn, could induce higher and more integrated and sophisticated forms of cooperation.

In line with the existing experiences, the proposed platform may serve the following purposes:

- To serve as a forum for discussing the common problems facing the financial and capital markets in the OIC countries and exchanging information, views and expertise on regulating these markets and related market practices and techniques and ways and means to develop capital markets in the member countries;

- To discuss and take the necessary steps for mobilising internal financial resources and facilitating the optimal utilisation of such resources in OIC investment projects;

- To help members disseminate information about their markets through the platform and exchange data and statistical records on member stock exchanges;
• To study, analyse and make recommendations on promoting and developing organised and regulated capital markets, in particular stock exchanges, in the member countries;

• To help member countries develop high standards of regulation and efficient financial markets and promote the harmonisation of market rules and procedures;

• To help support the establishment of new OIC stock exchanges on internationally recognised standards by offering know-how, expertise and facilities;

• To take the necessary steps for facilitating foreign investment in the OIC capital markets and help harmonise business standards and practices to facilitate cross-border/market trading of financial instruments;

• To take the necessary steps to bring member stock markets closer in terms of their rules, procedures and standards, thus increasing their integrability and helping their gradual integration;

• To represent the common interests of member stock exchanges in international fora and bodies such as the FIBV and the International Organisation of Securities Commissions (IOSCO).

Proposed Steps to Create a Mechanism for Cooperation in the Areas of Financial Markets and Clearing of Stocks and Bonds

Resolution No. 38/30-E, adopted at the Thirtieth Session of the Islamic Conference of Foreign Ministers held in Tehran on 28-31 May 2003, excludes the idea of establishing any new bodies while creating a mechanism for cooperation among the OIC Member States in the areas of financial markets and clearing of stocks and bonds. Therefore, only the existing mechanisms within the OIC system would be utilised for such a cooperation among the OIC members.

Obviously, cooperation and coordination in the areas of financial markets and the clearing of stocks and bonds are needed to create new and important modalities and opportunities for benefiting from the economies of scale in capital markets including stock exchanges.
Furthermore, such cooperation may further increase the utilisation of complementarities among financial institutions in the OIC member countries.

The creation of a cooperative environment among the financial institutions will contribute positively to the flows of foreign direct investment among the OIC member countries through facilitating the flow of financial resources. As a result, it will further contribute to their efforts to accelerate economic growth, develop their economic structures and consolidate their economic and commercial relations. Therefore, such a cooperation among the OIC member countries is indispensable.

On the other hand, within the fundamental terms of reference determined by the said Resolution, the creation of such a mechanism for cooperation among the OIC member countries necessitates close collaboration and coordination between the existing subsidiary, affiliated and specialised organs and institutions of the OIC. Furthermore, within the said framework, the best mechanism will be the creation of a platform among the regulated stock exchanges of the OIC member countries. However, the successful launching of such a platform also needs to be elaborated and well-prepared.

In this regard, a task force composed of OIC organs and institutions working in the field of economic and commercial cooperation will be formed to consider this mechanism in detail and lay the ground for the launching of such a platform. This task force will be responsible for defining the level and composition of attendance from the participating stock exchanges, basic aims, objectives and mandate of the said platform and also the terms of reference under which it would operate. In this respect, the Islamic Development Bank (IDB), which is the focal point for financial issues within the OIC system, will be requested to convene such a meeting. The task force is expected to report its recommendations to the Standing Committee for Economic and Commercial Cooperation (COMCEC) before it is put before higher OIC fora for final decision on its implementation.

6. CONCLUDING REMARKS

The creation of a mechanism for cooperation in the areas of financial markets and the clearing of stocks and bonds is an important project
which is vital for OIC economic cooperation, in general, and for enhancing investment opportunities in the OIC countries, in particular. Through such a project, existing stock exchanges, clearing houses and related financial institutions may coordinate and standardise their policies, rules, regulations and market techniques and procedures in an effort to bring them in line with those of the rest of the world. Standardisation and harmonisation will help regulated OIC stock exchanges and capital markets integrate and thus become a recognisable group and a force to be reckoned with in the international financial markets.

There is a two-way relationship between the vigour of any alliance and the strength of relationship and integrability of its members. Thus, the more integrated and integrable the OIC stock exchanges and other related institutions and markets are, the more vigorous their proposed alliance will be, and vice versa.

This paper suggests the launching of a platform to be formed among the OIC stock exchanges and other related institutions such as clearing houses. For this purpose, a Task Force composed of the OIC subsidiary organs and affiliated and specialised institutions working in the field of economic and commercial cooperation will be formed to prepare the ground for the launching of such a platform. The Task Force will be mandated to study the project and define the level and composition of attendance from the participating stock exchanges, basic aims, objectives and the mandate of the said platform and also the terms of reference under which it would operate. It is expected to report its recommendations to the COMCEC before they are put before higher OIC fora for final decision on their implementation.
